```
#include <iostream>
#include <vector>
#include <algorithm> // Needed for max()

using namespace std;

class Solution {
private:
  // Helper function placed inside the class
  int collectGold(int x, int y, vector<vector<int>> &mat) {
    int n = mat.size(), m = mat[0].size();

    // Base case: out of bounds
    if (x < 0 || x >= n || y >= m) { //Messed up the conditions for the base case
      return 0;
    }

    // Move to the right-upper cell
    int rightUpper = collectGold(x - 1, y + 1, mat);
    // Accidentally switched the incrementation of the x and y values
    // Move directly to the right
    int right = collectGold(x, y + 1, mat);
    // Move to the right-lower cell
    int rightLower = collectGold(x + 1, y + 1, mat);

    // Return the max gold collected from the three options
    return mat[x][y] + max({rightUpper, right, rightLower});
  }
```

```
public:
    // Public method that the Driver.cpp file calls
    int maxGold(vector<vector<int>> &mat) {
        int n = mat.size();
        int result = 0;

        // Try starting from each row in the first column
        for (int i = 0; i < n; i++) {
            int gold = collectGold(i, 0, mat);
            result = max(result, gold);
        }

        return result;
    }
};
```
